

Mixed species swards and enteric methane emissions

Zero-grazed:

Perennial
ryegrass -
white clover

Multispecies

Methodology:

- Swards harvested daily and offered to animals indoors
- Individual animal feed intake (Calan gate)
- Enteric CH₄ emissions (GreenFeed)
- Growth performance
- Sward botanical and biochemical composition

Take home messages

- No difference in feed intake, methane emissions or growth performance between PRG-WC and MSS
- Research underway to investigate the biochemical composition of both swards
