

Covid-19: Distribution of Populations with Higher Risks

Vulnerability Classification

About this map:

We show the result of an analysis that assessed the proportion of the population of each Small Area that was over 64 years of age, unable to work due to sickness or disability, reported their health status to be less than 'Good' and persons living in communal accommodation on the night of the Census (2016). For each indicator, we ranked Small Areas i.e. from 1 (lowest indicator value) to 18,641 (highest). We then combined these ranks to give an overall score. The classification of Small Areas into the different categories is based on a decile distribution, i.e. the 10% of Small Areas with the lowest scores are shown in Yellow whilst the 90%+ category shows the 10% of areas with the highest scores in Blue.
