How to use this guide

There are a large number of veterinary medicines on the market for parasite control and it is important to choose the correct product that is effective against the parasites that need to be controlled to prevent production losses and reduce the risk of anthelmintic resistance. This guide lists the products currently marketed in Ireland for use against parasites in cattle.

Types of antiparasitics available

The products are grouped as follows:

BENZIMIDAZOLES (BZ)	White drench, broad spectrum wormers
LEVAMISOLE (LV)	Yellow drench, broad spectrum wormers
MACROCYCLIC LACTONES (ML)	Clear drench, includes avermectins, broad spectrum wormers
FLUKICIDES	Effective against liver fluke
COMBINATION PRODUCTS	Active ingredients from multiple groups, usually a wormer and flukicide
ECTOPARASITIC PRODUCTS	Effective against external parasites
COCCIDIOSTATS	Effective against coccidia

The products in this guide are listed by the group of the product, the active ingredient and the parasites they are registered to control against. Different active ingredients target different parasites. Consult with a veterinary practitioner to assist in choosing the correct product for the specific conditions on-farm as part of a parasite control plan.

Withdrawal periods are the amount of time it takes for the animal to clear the drug from its body so that people consuming the animal product (e.g. meat or milk) will not be exposed to trace levels of the medicines. Withdrawal periods do not correspond to the length of time that the treatment is effective. Farmers must comply with the withdrawal period for any medicines used.

Always read the product information on the packaging before use to confirm the withdrawal period – do not rely on this guide as changes can take place

Using antiparasitics effectively

Treat appropriately

- Treat only when needed as part of a farm health plan that includes pasture risk management.
- Use the correct dose: follow the manufacturer's instructions and the indicated dose volume; dose according to the heaviest animal in a group and divide the group if there is a large variation in live weight.
- Use good dosing technique: calibrate equipment, ensure appropriate route of administration and that the anthelmintic is given according to the manufacturer's guidelines.
- Use an anthelmintic effective against the target parasite and its life stage.
- Follow the withdrawal period indicated for the product.

Safe handling

Follow personal safety measures when handling medicinal products. Observe storage guidelines, such as temperature recommendations and shelf life, particularly the reduced shelf life of products that have been opened. Dispose of the packaging and any unused product in an environmentally safe way, with attention to potential contamination of water courses as many products are extremely toxic to fish.

For more information on using anthelmintics effectively please refer to the guide on *Good Practice Regarding the Responsible Use of Anthelmintic Medicines in Livestock* [Click here](#).

Always read the package insert or product information sheet before use, particularly to confirm the withdrawal periods and usage information

While we have made every effort to provide accurate, up to date information on the products available, recent changes to the product specification may not be captured. Always read the package insert or product information sheet before use, particularly to confirm the withdrawal periods and usage information. The most updated information on any product is available at the HPRA website. Any errors or omissions can be reported to pc@animalhealthireland.ie

All information was captured from the HPRA and EMA websites (www.HPRA.ie, www.ema.europa.eu/) on 16th June 2023.
