In recent decades, the rate and scale of change in farming has outstripped the Burren's ability to adjust, resulting in a growing imbalance between farming and nature.

When **under**-farmed or **over**-farmed, the Burren's heritage becomes eroded – reducing the range of **ecosystem services** being delivered..

• This isn't unique to the Burren. Over 30m ha of High Nature Value (HNV) farmland in the EU face similar challenges - 16% of EU-designated habitats are in favourable conservation status, with farmland habitats faring worse.

Farming and 'Ecosystem Services'

Farmer: 'a person engaged in agriculture, raising living organisms for food or raw materials' (*Wikipedia*).

However, many farmers also have the potential to generate **additional 'Ecosystem Services'** using their land and livestock.

Biodiversity/pollination Cultural heritage

Carbon storage

Farmers are only paid for the food they produce, often doing so at the expense of other ecosystem services.

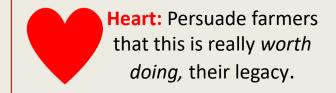

How do we motivate more farmers to deliver more 'Ecosystem Services'?

Pocket: Pay farmers to deliver clearly defined Ecosystem Services.

Head: Support farmers on *how* best to deliver Ecosystem Services.

If we want farmers to 'farm for nature' we must provide a more compelling proposition than what's on offer now.

1. Paying for Ecosystem Services using result-based payments model

'Paying for results' means that the farmer is free to decide how to manage the land

Simple Burren Score Card (focus on local priorities, optimising co-benefits)

- No payments for scores less than 5.
- Bonus payments for scores of 9 & 10.
- Annual payments of up to €315/ha, ceiling of €10k, average € 2,714.
- Degressive, banded payments with *lowest scoring fields paid first* in order to target these fields for urgent action.

2. Paying for *practical* **conservation actions:** Low scores \rightarrow Mgt issues \rightarrow Action needed!

Farmer nominates conservation tasks to suit his/her farm and boost the field score. Farmer also co-funds work.

Farmers avail of a fund (per ha) within which (s)he can nominate (and co-fund 25-75%) tasks to increase score.

3. Creating new economic and social opportunities for farmers and the local community

Supporting an average of 20 local jobs each year among Burren businesses, contractors and craftspeople

Promoting
opportunities for agritourism and
contributing to the
Burren's appeal as a
visitor destination

Case Study: Nagle Family Winterage

- Increased stocking levels by 20% through better management
- Annual premium payment for high field scores (mostly 10s)
- Employing several local contractors for work on scrub, water, walls
- Purchased 8-10 locally produced 'Burren' gates
- Uses Irish barley-based, bespoke Burren feed ration
- Regularly hosts visitors, study groups, media etc
- Employs local farm advisor, has support of local BP team, archaeologist etc

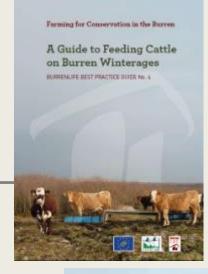

4. Co-creation - and on-farm demonstration of – innovative environmental solutions

5. Providing Environmental Training, Advice and ongoing Support – ideally at a local level

Part 3 - Parm conservation works

6. Sharing farmer's knowledge (peer to peer learning) – www.farmingfornature.ie

- 1: Rest meadows and pasture during the main flowering season. (May-July), in meadows this will allow flowers to seed and replenish the seed bank, in pastures it reduces nutrient load, competition, encouraging more flowering plants to thrive.
- 2 Good diversity of plant and insect species present.

Grazing Pastures

- 3: Graze in late Summer, Autumn or Winter at an appropriate rate, avoiding poaching (especially on wet ground) or undergrazing
- 4: Mulch any encroaching scrub before it gets too large or before it encroaches too widely. Invasive species - creeping thistle, bracken, thoms - controlled before seeding and before they become dominant
- 5: After grazing, aim for a grassland with 'tufts and lawns' as this will allow the best range. of biodiversity to prosper

Mowing Meadows

- 6 if the weather permits, save hay instead of slage as more seeds will be shed in the meadow as the crop dries out
- 7.Start mowing in centre of meadow as this will allow any remaining wildlife a better chance of escaping
- 8:Dan't mow if you suspect the presence of ground nesting birds
- 9.After saving the grass crop, graze the aftermath with livestock they will help to enhance the vegetation structure and create niches for new seedlings to establish
- 10:There may be good demand for hay from species rich meadows.
- 11:Dung and farmyard manure helps improve organic matter levels in the soil

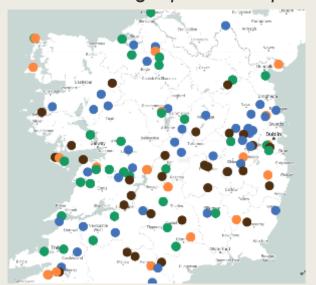

Best Practice Guides

7. Giving farmers a voice - sharing a more positive, practical narrative around farming and nature

The Farming for Nature Ambassadors Programme

'To change the world, let's start by changing the way we talk about it, and let's highlight those initiatives that are having a positive impact on people and the planet, to renew our confidence and spur us into action' (Sparknews)

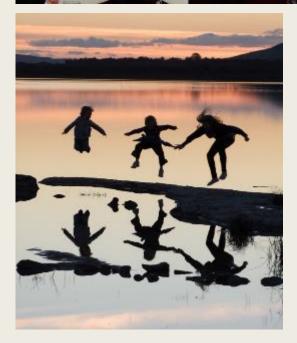

FARMING FOR **nature**

8. Investing in the future guardians of the land – place-based learning

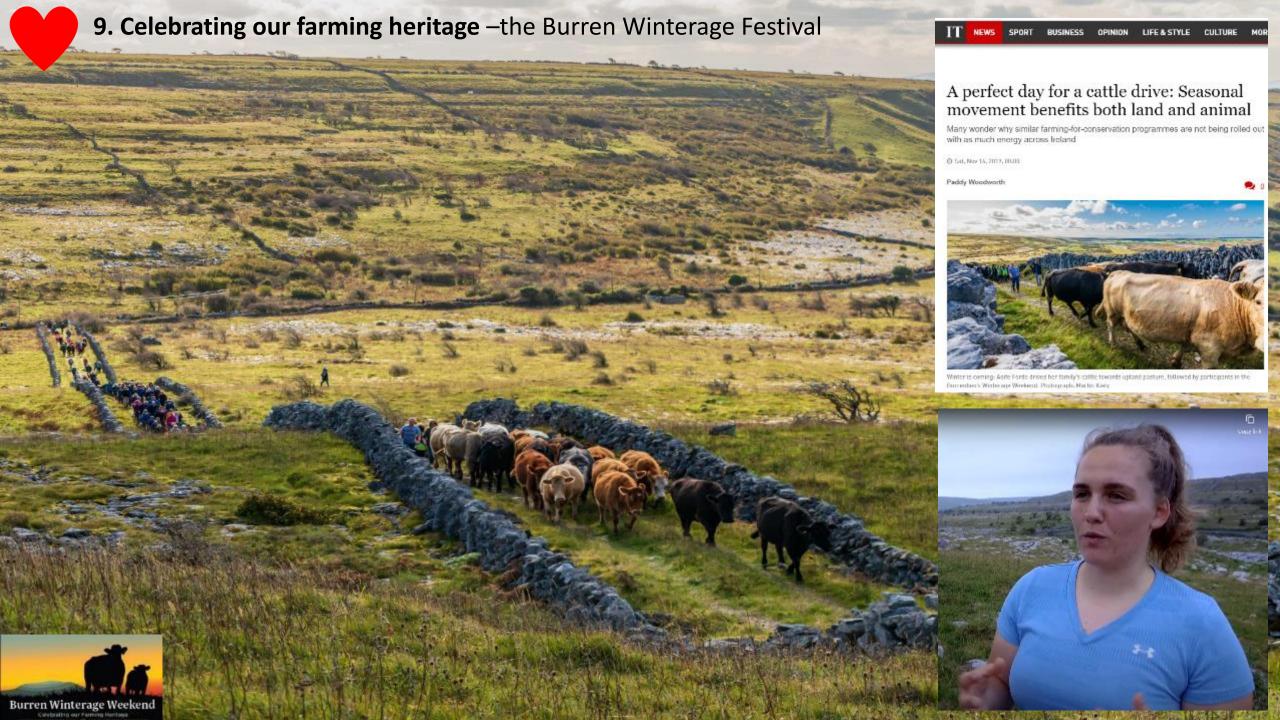

Using critical thinking and having fun, to foster a sense of informed pride and stewardship of your place

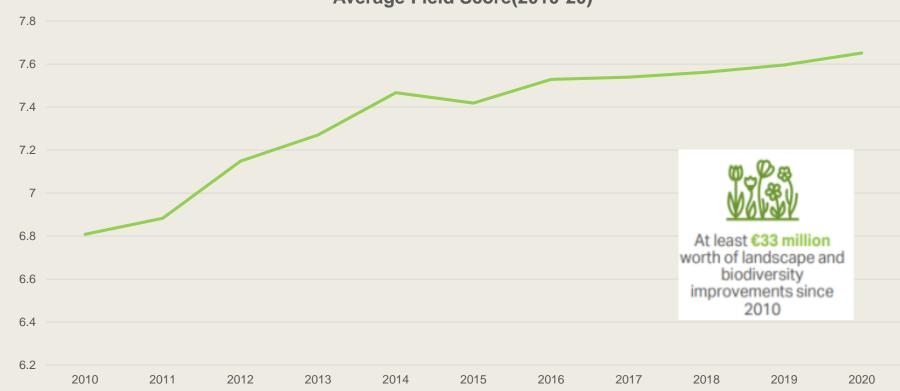

All pie in the sky or does this approach actually work?

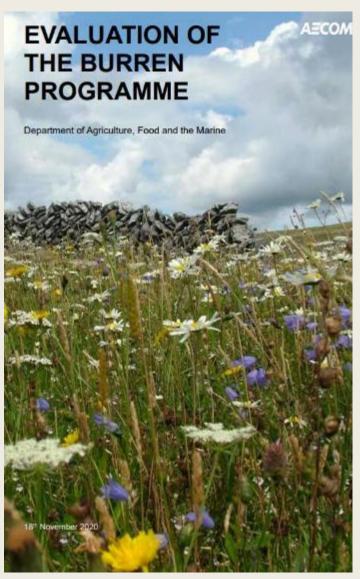

Average Field Score(2010-20)

IMPACT: Consistent improvement in Environmental outcomes since 2010

When properly supported, our farmers can be the 'first responders' to our climate and biodiversity emergency.

Let's start by designing better, farmer-friendly supports that are:

<u>Local</u> – design, management etc – greater pride of place, ownership

<u>Fair</u> – money *earned* should reflect both effort and outcomes

<u>Flexible</u> – ensure freedom to farm, to innovate, to adapt (weather, disease..)

<u>Simple</u> – e.g single, integrated whole farm sustainability plan, minimise need for receipts, support to secure permissions, payments etc.

<u>Long-lasting</u> – continuity - of support, of payments etc – builds trust

<u>Engaging</u> - Positive (language, incentives), inclusive, fun, celebratory.
